Report on Smart Voice Notepad App

1. Introduction

The Smart Voice Note App is made using MIT App Inventor. It allows users to create notes by speaking. The app converts voice to text (Speech to Text), saves the notes in a file, and can read them aloud (Text to Speech).

2. Objective

- To make notes using voice.
- To save notes in a file.
- To open saved notes by filename.
- To read notes aloud using a speaker.

3. Tools Used

- MIT App Inventor 2 (for designing the app).
- Android Phone (for running and testing).
- Speech Recognizer (voice → text).
- Text to Speech (TTS) (text → voice).
- File Component (save and read files).

4. Steps to Use the App

1. Open the app.
2. Type a filename in the first box (example: My self).
3. Click VOICE button and speak → Your speech appears as text in the box.
4. To hear the note, click READ NOTES.
5. To save the note, click SAVE → It is stored with the filename.
6. To open a saved note, type the filename in the "Typing Filename" box and click OPEN.
7. The note will appear, and you can also read it aloud.

5. Advantages

- Faster than typing.
- Saves time and effort.
- Easy to organize notes with filenames.
- Useful for students, teachers, and professionals.
- Helpful for people with typing difficulty.

6. Conclusion

The Smart Voice Note App is a simple and useful app. It combines voice input, file storage, and text-to-speech features to make note-taking easy, fast, and smart.
